## PRODUCTS

Design and construction of molds for the manufacture of technical items in rubber and thermoplastics.

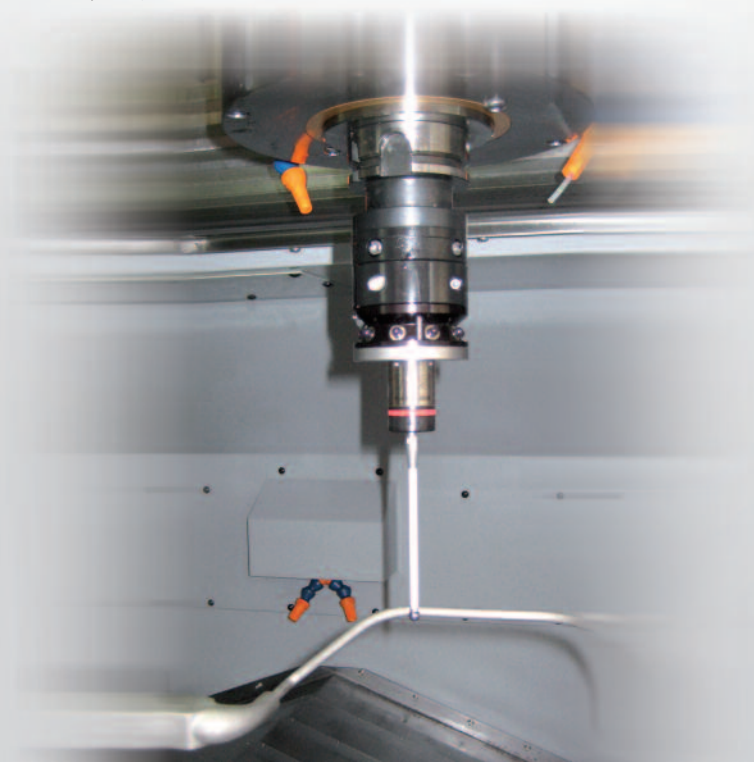

## DESIGN AND MACHINING

Each mold is subjected to a specific technical study that seeks the right balance between quality, molded parts, mold productivity and simplicity of the possible automatism.

- Molds for technical articles in rubber, plastic and thermoplastic.
- First-batch technical articles.
- Prototypes.
- Machining of special steels, aluminum and titanium for a variety of business markets including medical, naval aviation and automotive industries.
- Development of thermo regulated rubber and silicone molds.

Possibility to manufacture internally mold samplings.

"An innovative mold is designed by experience and by technology, and it is created by machines and especially by the people through their creativity and professionalism".
